

FIELD SURVEY & COORDINATION REPORT

Location: Bidur Municipality (Nuwakot District)

Date: 10 September 2026

Focus: Post-disaster recovery, rehabilitation, and waste management

The team coordinated with local representatives from different wards to assess the challenges communities are currently facing. The survey found that immediate relief-material needs around Bidur are saturated, while excess relief materials are accumulating. The primary concern has therefore shifted to **long-term recovery and creating a safe, sanitary environment**.

The team also visited **Bidur Municipality** and coordinated with the Drinking Water and Waste Management Division regarding the next phase of work.

Findings

- Immediate relief-material needs in and around Bidur are currently covered.
- Excess relief materials are accumulating, reducing the need for further distribution.
- The main remaining needs relate to waste management, sanitation, rehabilitation, and long-term recovery.
- The baseline assessment is nearly complete, allowing the team to proceed with implementation planning.

Key Outcomes

- The team will temporarily **stop providing and distributing relief materials** because nearby areas are sufficiently supplied.
- The Public Health and Hygiene Team will shift its focus toward **waste management, sanitation, and post-disaster recovery**.
- As part of the first pilot project, waste will be managed through proper segregation into different categories, including **degradable and non-degradable waste**, followed by appropriate collection and disposal.
- Coordination with **VON Nepal and Hami Nepal** is progressing well: VON Nepal will support volunteer mobilization, communication, and coordination; Hami Nepal will support waste-management activities, installation of toilets in necessary holding camps, and provision of relief materials and inventory required in the field.

Priority Actions

- 1 Coordinate with **Bidur Municipality and local wards** to finalize the recovery and waste-management roadmap.
- 2 Develop a **waste-segregation and management module** covering degradable, non-degradable, and toxic waste.
- 3 Assess resources and materials required for **toilet construction and sanitation facilities**.
- 4 Prepare the required **designs, material lists, budget, and implementation plan**.
- 5 Identify and mobilize additional **field volunteers**.
- 6 Assign responsibilities according to team availability, skills, and inputs.
- 7 Establish procedures for waste collection, transportation, disposal, and monitoring during the pilot project.

Next Steps

The team will finalize the roadmap with Bidur Municipality and the relevant wards, complete the waste-management module, and confirm the resources required for sanitation and toilet construction. Volunteer mobilization and partner coordination will continue in parallel so that implementation can begin once the design, budget, materials, and responsibilities are approved.

Conclusion

The team is ready to transition from initial relief activities to **post-disaster waste-management, sanitation, and rehabilitation work**. The next phase will focus on proper waste segregation, safe collection and disposal, improved sanitation facilities, coordinated volunteer mobilization, and the development of a sustainable recovery system.
